SUMMARY OF KEY FINDINGS

Project Goals and Team:

Mission: The main objective is to calculate the ROI of VidyaVerse's "#DataDreamer" social media campaign and determine which platform—YouTube, Instagram, or LinkedIn—attracted the most valuable students.

Team: The team consists of Vicky, Akash, Deepak, and Shreyas.

Project Phases and Tasks
The project is broken down into five phases:-

Mission Scoping & Hypothesis Mapping (30 mins): The team will define the investigation's structure and create a hypothesis map to explore the effectiveness of each platform. Vicky is responsible for creating the map, while Akash will set up the Notion workspace.

The Data Laundromat : This phase focuses on cleaning and standardizing raw data. Deepak will handle loading and fixing data issues in the campaign_performance.csv file, and Shreyas will document the cleaning process.

The Great Merge : The goal is to combine marketing and student data using SQL joins. Akash will set up the MySQL data warehouse, Vicky will write the master JOIN query, and Deepak will validate the merged data quality.

The Eureka Moment - Analysis : The team will calculate key metrics and identify the winning platform. Shreyas will load the master dataset, Vicky and Shreyas will engineer key metrics like

Cost Per Signup (CPS) and Cost Per Completed Student (CPCS), and Deepak will group and compare the platforms
Crafting the Data Story (30 mins): The final phase involves turning the analysis into a persuasive business recommendation. Akash is tasked with creating a presentation, and Vicky will conduct industry benchmarking to provide market context.

<u>Key Metrics to Be Calculated:</u>

The project outlines four key metrics to be calculated to assess campaign performance:

Cost Per Signup (CPS): Ad Spend divided by Total Signups.

Cost Per Completed Student (CPCS): Ad Spend divided by students with over 90% completion. This is described as "The killer metric".

Completion Rate: (Completed Students / Total Students) * 100.

ROI: (Revenue - Ad Spend) / Ad Spend.

Expected Deliverables and Questions to Answer:-
The project's final deliverables include a publicly shared Notion workspace, a Hypothesis Map, a well-commented Google Colab Notebook, and a Google Slides presentation .

The team needs to answer a primary question: which platform's reach brought in students who actually finish the course? Secondary questions include whether high ad spend on a specific platform was justified by the quality of students it brought in and what the budget allocation should be for the next campaign.
